

## viewMAX - Secured three level network infrastructure

- 1. Level** viewMAX SQL clients using the existing infrastructure
- 2. Level** Standard FTP communication between viewMAX server and displays
- 3. Level (optional)** For security reasons WLAN devices may be separated by an additional router

There will be no routing traffic between first and second or third level. Depending on their security requirements viewMAX customers have the choice of up to three network setups. The one level network structure allow to install all components on one single homed PC. With each of the following levels the security and costs will be increased. The Microsoft Windows XP™ multi homed viewMAX Server in combination with an additional router provides the highest security for the existing IT infrastructure.
